

EXPLORATION THROUGH RESEARCH

- Since the last time you wrote about your research, what did you find out? Did your driving question or topic change? Why or why not?
- Now that you are in the "student-led research" part of the process, which student-led research option are you doing? (Survey, interview of an expert, observation, or experiment) Why?
- What has been easy and what has been difficult about this process?
- In your next steps, what do you need to do to make sure you successfully complete this component of the project? What are some things you need to do?
- How is your collaboration going so far? What is working well and not working well?

The student led research so far is going great the only problem is that we need to find come up with unique questions that will supply us with useful information from our survey. Our Driving question did change a lot and our topic change about 3 times, which did set us back a bit but we are starting to catch up again. Our topic changed 3 times because the first topic, nanotechnology, was to vague. The second topic had too little resources to be found, nanomedicine. For our last and final topic was perfect, the ethical issues on nanotechnology and privacy. So far our group is doing great, we have caught up almost completely and the articles we find are filled with great information on our topic. The only thing that isn't working as well as we would want it to is our survey questions and the answers people can choose. Finding the articles was the easy bit, the hard bit was annotating all of them, since each group member had to do their own annotations.
